     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                         Score

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present amino acid sequence is encoded by the endogenous plasmid Propionibacterium LMG 16345 ORR-2, derived from Propionibacterium freudenreichil deposited under CBS 101022 or CBS 101023. The vector has insertion sites for foreign DNA fragments and is capable of autonomous replication. It can be used safely as they remain extrachromosomal and are very stable. They can be used to express homologous or heterologous proteins, which may include antigens for use in vaccines, nutritional, growth and clotting factors, antimicrobials, vitamins (especially vitamin B12), enzymes, hormones and drugs. The Propionibacterium host cells are used in the production of animal feeds, manufacture of foodstuffs like, sausages and cheese, where they may be used instead of or in addition to lactic acid bacteria and in the manufacture of vitamin B12. The DNA sequence can also be used as a source of primers and probes.
                                                                 Mycobacteria expressing secretion signal of lipoprotein and heterologous antigen, esp. outer surface protein A or B of Borrelia burgdorferi - are used in the form of a live bacterial vaccines
                                                                                                                                                                        Stover
                                                                                                                                                                                                                                                                                                                                                                                     surface protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the plasmid pMV101. This plasmid was used in the construction of series of vectors used to produce the recombinant Mycobacteria of the invention. The recombinant mycobacteria of the invention are transformed with DNA encoding a polypeptide which comprises a lipoprotein secretion signal sequence and an antigen (Ag) heterolo to the mycobacteria. The lipoprotein secretion signal causes the to be produced as a lipoprotein. The mycobacteria may be used in form of a live bacterial vaccines against Lyme disease, where the bacteriae express a surface protein of Borrelia burgdorferi, the causative agent of Lyme disease. This sequence is printed in the specification in the C-terminal to N-terminal orientation as
                                                                                                                                                                                                                                                                                                                                                                                               cytotoxic T-lymphocyte response; transformed Mycobacteria; BCG; Mycobacterium smegmatis; vaccine; cell mediated immunity; HIV; pertussis; malaria; influenza virus; CTL; herpes virus.

                         09-JUL-1991;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is the tet e gene product encoded by plasmid pMY101. When the nucleotide was decoded, the sequence in the specification was found to contain several deletions and insertions which upset the reading frame. Also many codons were found to encode amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytotoxic T-lymphocyte response; transformed Mycobacteria; Mycobacterium smegmatis; vaccine; cell mediated immunity; pertussis; malaria; influenza virus; CTL; herpes virus.

                                                                                                                                                                                                                                                                                                                                                           RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plasmid pYUB12 was constructed by ligating a 5kb Sau3 fragment from pAL5000 (contg. a replication origin from M.fortuitum) to BamHI-dispeted pIJ666 (contg. an E.coli ori and kanamycin-neomycin resistance sequences). A 2566bp HpaI-EcoRV fragment from pYUB12 (comprising the minimum sequence necessary for plasmid replication in BCG) was ligated to PYUBI-dispeted pYUB8 to form pYUB53. (Plasmid PYUB8 is a pBR322 deriv. which includes an E.coli replicon and a kanamycin resistance gene). Twelve restriction sites were removed by digesting pYUB53 with Aatl, EcoRV and PstI. To eliminate 792 bases of the (inactivated) tet gene, the plasmid was digested with Circularised. The resulting plasmid was designated pWT01. The nucleotide sequence of plasmid pWT01 is printed in the specification but the copy quality is too poor to allow the sequence to be included on the GENESEO nucleotide database. Three proteins are encoded by pMV101, i.e. the kanamycin resistance protein and proteins "d" and "e" encoded by the complementary strand. See also AAR20992 and AAR20993.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bordetella pertussis possesses a type III secretion system. Type III secretion systems allow bacteria to target virulence factors directly at host cells. The present sequence is a protein of B. pertussis. No name has been specified for the present sequence. The coding sequence of the present sequence is homologous to housekeeping genes of other species, and so the present protein may have a role in cellular housekeeping. A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The coding sequence of the present sequence is located within a pathogenicity island (see AAA64890) which also carries, a number of genes encoding proteins involved in the type III secretion system of B. pertussis. See AAA64894-A64884 and AAB14111-B14146 for details of the coding sequences and proteins identified in the pathogenicity island, of the present invention.
                                                                                                                                                                                                                                                                                                 C glutamicum protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polypeptides derived from Bordetella pertussis, useful treating and diagnosing Bordetella infection -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAU44478 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expression
         Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                                                               SAPHO syndrome;

A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the cloning and sequencing of the cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a transcriptional activator encoding Streptomyces nour.

The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central
